This flow diagram describes the method of operation of the admin page of the Pressabl theme. The admin panel is controlled via the PixoPoint_Templating_Framework class, which is instantiated in the functions.php file of the theme. The admin panel stores the data in a format suitable for use by the front-end of the site.

```
PixoPoint_Templating_Framework
              │
              ▼
         __construct
```

A noticeable difference between Pressabl and other themes, is that the templates themselves are stored inside the database.

Settings for typical "functions.php" functionality, such as post thumbnails, menus etc. is stored in an option. The templates themselves are stored as static files in the uploads folder (code not written yet).

All data is stored in posts too. This means that some data is stored twice, but allows for both post revisions and the storage of draft revisions.
